SUMMARY

OPERATING DEVICE FOR REAR SIDE  
WINDOWS ON CABRIOLET VEHICLES

5        This includes at least one slider joined to the window  
which slides along the rail defining the trajectory for the  
window defined by the departure angle formed by the vertical  
and initial upper curvature of the rail which is  $+ 45^\circ$  and  
the curvature radius of the aforementioned trajectory which  
10 is  $\approx 500$  mm. It includes a means of adjusting the position  
of the device with regard to the door including an upper  
pivoting axle on the rail which allows the device to tilt to  
fit it in the door with two lower transversal screws for  
their lateral adjustment and one screw on the slider for  
15 adjusting the glass with regard to the rail -- slider  
equipment.
